

# Compression Options

The **Compression** tab allows you to configure compression settings for your interaction. The lower the quality of images and audio/video objects, the smaller the size of the resulting file.

Compression	
Preset	iSpring Visuals offers four preset compression modes that optimize a interaction for the web with low or high connection speed, publishing it to the Local Network drive. You can also create up to five custom compression presets to suit your needs.  You can save a custom preset by clicking the <b>Save preset</b> button. To delete a custom template, click <b>Delete</b> .

Image Compression	
Image Compression	If you choose <b>Smart</b> mode, all images will be saved, keeping their high quality and small size. Read more about <b>Smart</b> compression in the <a href="#">iSpring blog</a> . <b>Lossy</b> compression will convert and save all embedded images to .jpg format. <b>Lossless</b> compression converts all images in your interaction with the highest quality.

Audio Compression	
Audio Compression	All audio files will be converted with the selected quality between 0% (low) and 100% (high). To ensure better quality of an audio file, choose the 50% value or higher. Higher quality values will increase the output file size.  <b>Note:</b> Audio Compression setting has the influence on the audio stream in the video files. By dragging the <b>Audio Compression</b> slider, you can change the quality of the audio stream in a video file.

Video Compression	
Video Compression	All video files will be converted with the selected quality between 0% (low) and 100% (high). To ensure better quality of a video file, choose the 50% value or higher. Note, that higher quality values will increase the output file size.
