

Adjusting Volume

You can adjust the volume of any audio clip in your simulation.

To do volume adjustment for audioclips:

1. Click the **Adjust Volume** button on the toolbar. A new window with the volume settings will pop up.
2. Drag the volume slider to increase or decrease your clip volume. Use the **Play** button to check the volume level.

If your audio clip is too quiet, you can increase the volume. However, that will also increase the background noise. Use [Remove Noise](#) to get the perfect volume of your vocals without any hiss or rumble in the background.
