

Section 508 Compliant Courses

Now, eLearning authors can create accessible content for users with visual impairments.

You can create courses which users with a visual impairment can easily take. To create accessible courses, you don't have to make different versions or master a new tool – you just build a course in iSpring Suite as you usually do, and tick a single checkbox.

iSpring Suite creates courses in accordance with [Web Content Accessibility Guidelines \(WCAG\) 2.0](#).

A special publishing format allows learners to switch to the accessibility mode by clicking on the glasses image.

The screenshot displays the iSpring Suite course interface in accessibility mode. In the top left corner, there is a 'Glasses' icon with a tooltip that reads 'Enable screen reader mode'. The main content area is titled 'SPACE SHUTTLE PROGRAM' and includes a video player showing a space shuttle launch. To the right of the video, there is a 'CHAPTER 11' section with a list of topics: '1. What is the Space Shuttle program?', '2. Early history of the program', '3. Space shuttle and its missions', '4. Shuttle description', '5. List of flights', '6. The last flight', and '7. Program retirement'. On the left side, there is a 'TABLE OF CONTENTS' section with a search bar and a list of topics corresponding to the main content area. The video player has a progress bar and controls for play, pause, and volume.

Here's how the course looks in regular mode:

Marker Tools | Presenter Info | Resources

SPACE SHUTTLE PROGRAM

THE LAST FLIGHT OF THE SHUTTLE

The last flight in the Space Shuttle Program was made by Atlantis. With 32 missions and more than 25 years of service, Space Shuttle Atlantis carried more than 200 astronauts and flew more than 100 million miles. Its legacy spans the years from the Shuttle-Mir flights to the final servicing mission of NASA's Hubble Space Telescope.

- [Creating an Accessible Course](#)

Differences of the Accessibility Mode

Here's what you can expect from the accessibility mode:

1. **Perceivable texts.** Clear fonts and high contrast make it easy for a person with a visual impairment to read the text on the screen.
2. **Minimalistic layout.** Courses include only the most necessary elements, which keeps the interface clear of distractions. Such neat and succinct slides are easy to navigate for those who use only a keyboard to work on a computer.
3. **Screen reader-friendly content.** Screen readers, as the name suggests, turn text into speech and allow users to navigate with the keyboard, e. g. jump between elements, select checkboxes, and fill in fields. This way, people with visual impairments can use computers without anyone's

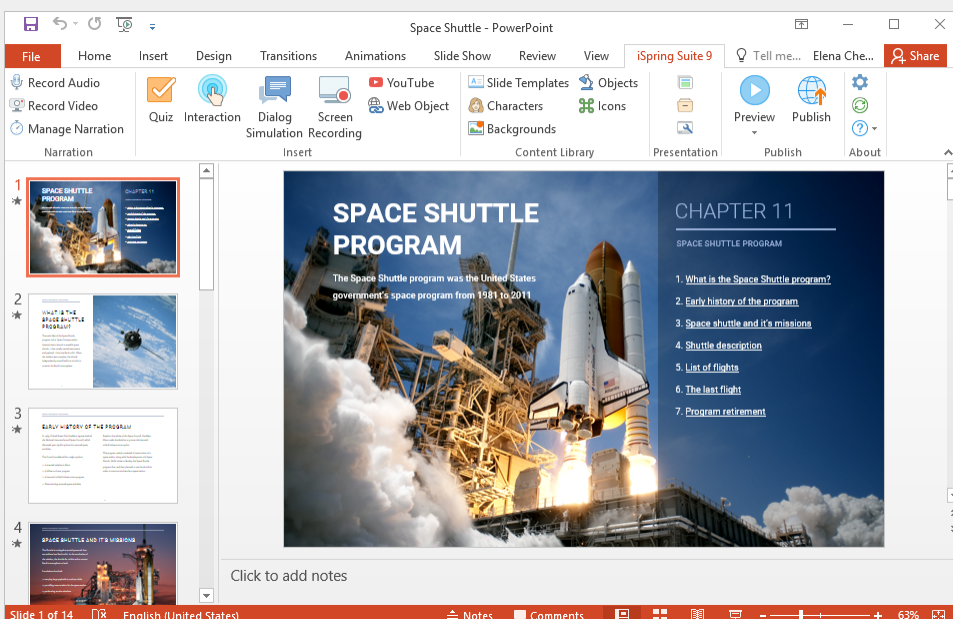

assistance.

If digital content isn't optimized for screen readers, there might be issues. For example, a screen reader might voice content in the wrong order or be unable to activate checkboxes.

Courses created with iSpring Suite are perfectly recognized by the most popular screen readers: JAWS, VoiceOver, and NVDA.

Creating an Accessible Course

1. Create a new course in iSpring Suite or open an existing one.

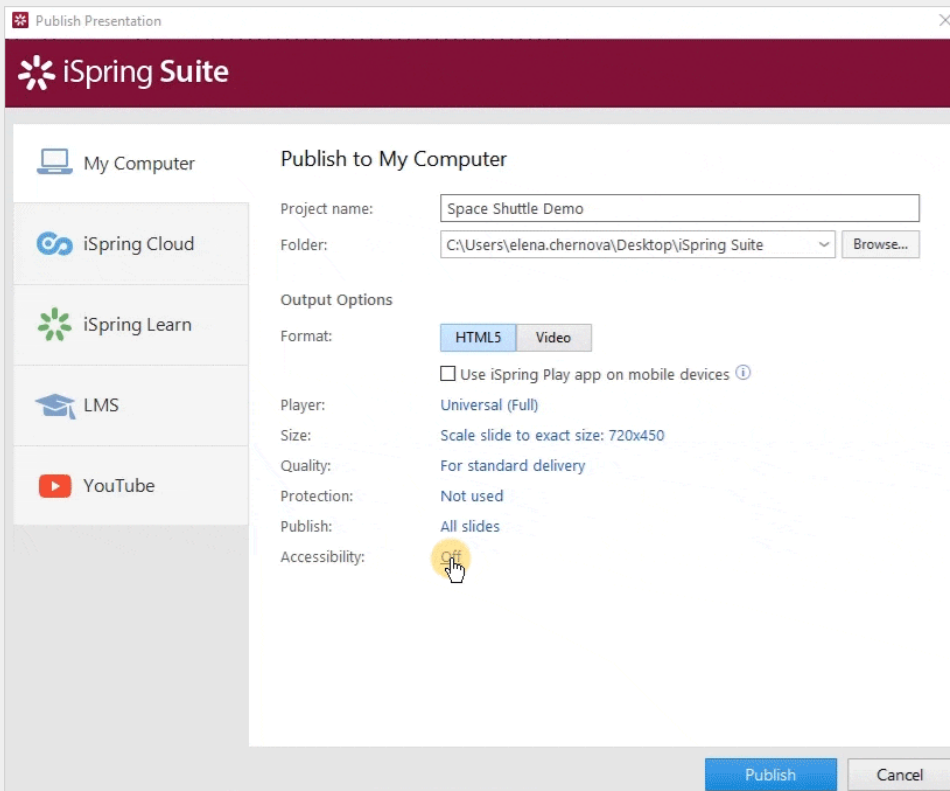

2. After your course is ready, click **Publish** on the toolbar.

3. In the **Publish Course** window, select one of [publishing destinations](#): **My Computer**, **iSpring Cloud**, **iSpring Learn**, or **LMS**. Then, in the **Accessibility** field, click on the **Off** link.
4. Next, tick the **Enable screen reader mode** option and choose a language.
A screen reader pronounces text in the language you set, and if it doesn't match the actual language of your course, the screen reader will voice it over with a strange accent.

5. Your course is all set! Now, click the **Publish** button.

Important:

1. Rely on text rather than on images to convey the important info. Include meaningful data in the question wording or, at least, add alternative text (alt-text) to a picture.
2. The same goes for videos: don't forget that some of your learners are only able to hear it, not see it.
3. For now, the accessibility mode is available only on desktop computers and laptops.
4. Quizzes and interactions inserted in the course will also be published in accessibility mode. Learn how to compose [tests](#) and [interactive modules](#) so that low vision individuals can take them more readily.
5. In the accessible mode, apart from the slide text, the outline, resources, notes, and presenter info are displayed. You'll need to enable all of these elements in [the player settings](#).
6. [Audio](#) and [video narration](#) recorded under the **iSpring Suite 9** tab can be listened to and viewed in accessibility mode.
To show video narration in accessibility mode, select the [Universal](#) or [Video Lecture](#) player for your course. In the Universal player, don't forget [to enable the video pane on the sidebar to display the presenter's video](#).
7. Audio and video, uploaded from the computer and recorded under the **Insert** tab in PowerPoint, can also be listened to and viewed in accessibility mode.
8. If a shape or an image on a slide doesn't contain any text, alt text (a description that is shown to people who can't see the object), or links, they won't be displayed in accessibility mode.
If you want to show a shape or an image in accessibility mode, add some text, alt text, or a link to them.
9. Arrange the order of slide items in accessibility mode in the [Selection Pane](#) section.
